

Problem

Companies experience business process errors through incorrect deliveries. When deliveries, especially chemical deliveries, are not completed properly causes disastrous results.

How Does Check Scan Work?

TSG's Del-Check Validation System created a program where handheld scanners in conjunction with barcoded labels (along with combination locks) prevent incorrect deliveries. The TSG team's bulk delivery validation system provides employees to electronically capture delivery details based on a bill of lading then validation the delivery driver's scans and/or input throughout the delivery process to ensure all scans match.

In the event of any mistakes made during the delivery process, the driver receives a detailed error message and the Del-CHECK system records each scan of the transaction with the driver's name, timestamp, and status indicating whether the scan was successful or in error. The captured data provides companies with valuable information to determine gaps within the delivery process and the ability to quickly resolve those issues.
